

Rhapsody EMPI: A proven solution for enterprise identity data management

Overview

Rhapsody® EMPI enables healthcare organizations to know their patients better. By associating records across disparate systems, an EMPI forms a single, comprehensive view of each person that can be shared upstream and downstream to facilitate every person centered initiative from care coordination to patient engagement.

Easy integration

Connect EMPI seamlessly to systems across your organization using your existing integration engine or the leading Rhapsody® Integration Engine. The API Toolkit documents connectivity parameters, simplifying the integration process.

The EMPI is available as a HITRUST and ISO 27001 certified managed Software as a Service (SaaS) solution hosted on AWS, as an on-premises software installation, or in your private AWS or Azure cloud.

Efficiencies

The next-generation Rhapsody EMPI helps improve operational, clinical and financial outcomes through efficiencies including:

- More rapid integration of person data post M&A
- Automated duplicate record cleanup
- Streamlined patient registration across care settings
- Connected digital front door experiences
- Enhanced data quality in support of data governance
- Decreased duplicate diagnostic and lab procedures

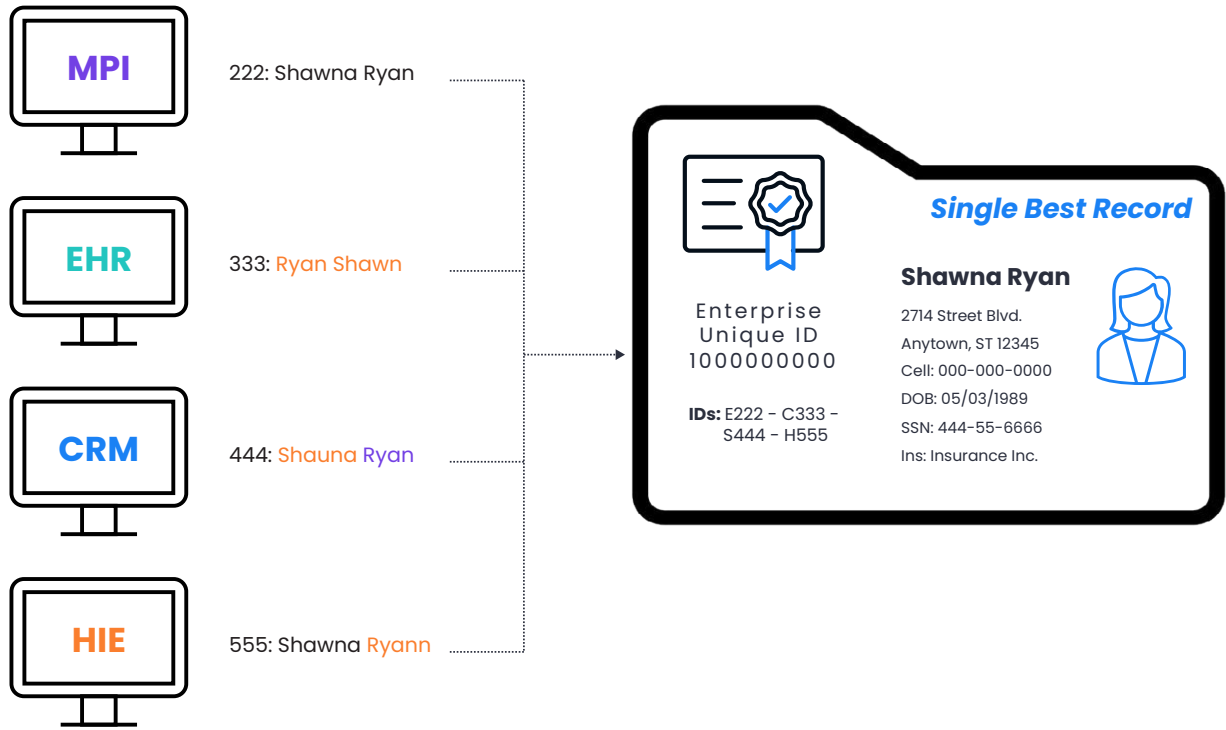

Challenge:

Inaccurate and duplicate identity data negatively impacts patient care, billing, reporting, and other strategic initiatives.

Solution:

Create a single, comprehensive, and accurate record for each patient that can be used throughout the enterprise.

The Rhapsody EMPI single best record (SBR) serves as the source of truth for all connected systems

Rhapsody® Professional Services are among the most experienced in the industry. Our proven implementation can help ensure you're up and running according to your project timeline, in as little as just a few weeks.

How it works

Rhapsody EMPI creates a single, centralized, and reliable index of a person's demographic information. It identifies any other potential records for that person throughout the ecosystem and offers intuitive dashboards and data stewardship tools to help make record reconciliation easy. It assigns a unique enterprise identifier (EUID) and presents an aggregate of the best up-to-date data in what's known as the Single Best Record (SBR).

Using the EUID as a key, personnel and all other internal applications can find, exchange and view data in the original context. The EMPI incorporates advanced matching algorithms tuned for your specific population to understand the slight variations in data content, increasing the likelihood of finding and resolving a match.

And with Referential Resolution, Rhapsody EMPI leverages commercially available evidence to automate and support match decisions, making data reconciliation faster and more accurate while reducing costs.
